Immune Response to a Major Epitope of p24 during Infection with Human Immunodeficiency Virus Type 1 and Implications for Diagnosis and Prognosis

BLANDINE JANVIER, ARMELLE BAILLOU, PHILIPPE ARCHINARD, MARCELLE MOUNIER, BERNARD MANDRAND, ALAIN GOUDEAU, AND FRANCIS BARIN

Laboratoire de Virologie, Département de Microbiologie Médicale et Moléculaire, URA CNRS 1334, CHRU Bretonneau, 37044 Tours, UM 103 CNRS-BIOMERIEUX, 69064 Lyon, and Laboratoire de Bacteriologie-Virologie, CHRU Dupuytren, 87000 Limoges, France

Volume 29, no. 3, p. 488-492: The amino acid sequence recognized by the murine monoclonal antibody 23A5G4 directed to p24{sup HIV-1} was IRQGPKEFPRDVDRFYKTL (amino acids 285 to 304 of p55) and not AAEWDRVHP (amino acids 209 to 217 of the gag precursor). These data were confirmed by inhibition assay by another group (V. Robert-Hebmann et al., Mol. Immunol., in press).
